The Petersen graph

Coloring the Petersen graph

- 1 The Petersen graph can be easily colored with four colors
- 2 Can it be colored with just three colors?
- 3 What about two?
- 4 We can answer these questions by a reduction to SAT

Reducing 3COL to SAT

- ① Learn about the DIMACS format for SAT CNF problems
- ② Write a program to reduce instances of 3COL to SAT
 - Use an adjacency list format for input
 - Use the DIMACS format for output
- ③ Which kind of reduction is obtained?
- ④ Use PicoSAT to determine if the Petersen graph is 3-colorable
- ⑤ If so, find two different colorings

Cliques and colors

- ① Which is the clique number of the Petersen graph?
- ② Which is its chromatic number?
 - **Hint:** you can reduce 2COL to SAT too
- ③ Could it have contained a clique of size four?
 - Why is this or not possible?
 - Which is the relation between colors and cliques?
